Portside Logistics -- Vehicle Maintenance Manual

Applies to all company-owned trucks and vans across the Chennai, Bengaluru, and Mumbai depots.

1. Purpose and Fleet Overview

This manual sets the maintenance schedule and out-of-service rules for the Portside Logistics fleet. Every service event, whether scheduled or a roadside repair, must be logged in the fleet maintenance system within 24 hours so the vehicle's service history stays accurate for the next inspection.

2. Daily Checklist

Before any vehicle leaves the depot, the driver checks tire pressure on all axles, confirms all exterior lights are functioning, and looks underneath the vehicle for fresh fluid leaks. This is in addition to, not a replacement for, the full pre-trip inspection in the Safety and Compliance Guide.

3. Scheduled Service Intervals

The table below lists the minimum service intervals for the standard fleet. Vehicles running hazmat routes follow a shorter brake and tire inspection interval set separately by the compliance team.

Service Item	Interval
Engine oil and filter change	Every 10,000 km
Brake inspection	Every 20,000 km
Tire rotation	Every 15,000 km
Full safety inspection	Every 6 months

4. Out-of-Service Criteria

A vehicle is pulled out of service immediately, without waiting for the next scheduled interval, if any of the following are found: tire tread below the legal minimum, a brake warning that does not clear on restart, a cracked windshield that obstructs the driver's view, or a fluid leak that is active rather than a residual stain.

5. Roadside Breakdown Procedure

If a vehicle breaks down on the road, the driver places the hazard triangle behind the vehicle, turns on hazard lights, and calls the roadside assistance line before doing anything else. Drivers do not attempt repairs on an active roadway; the vehicle is towed to the nearest depot or an approved partner garage.

6. Maintenance Logging Requirement

Every service event, scheduled or roadside, is logged in the fleet maintenance system within 24 hours, including odometer reading, parts replaced, and the depot mechanic who performed the work.
